*New York Magazine Jul 08 2020 New York magazine was born in 1968 after a run as an insert of the New York Herald Tribune and quickly made a place for itself as the trusted resource for readers across the country. With award-winning writing and photography covering everything from politics and food to theater and fashion, the magazine's consistent mission has been to reflect back to its audience the energy and excitement of the city itself, while celebrating New York as both a place and an idea.*

Grammar Time 1 Student Book Pack New Edition Feb 24 2022 The teacher's book expands into a resource file and includes photocopiable activities that help the teacher to deliver lively and varied lessons. Easy-to-teach units are presented in a consistent format, and regular reviews and tests monitor student's progress.

Measurements of Around-the-world High-frequency Propagation Sep 21 2021 Studies of round-the-world (RTW) signals, with transmitter and receiver at the same location, were made using 50-kw, 1-msec pulse transmissions in the 12- to 28-mc range. Information includes av. monthly curves of RTW max frequency vs time of day, time delay and pulse dispersion as a function of radio frequency, variation of optimum propagation azimuth with time of day, and degree of degradation of RTW propagation by geomagnetic storms. Predicted curves of av. monthly RTW max propagating frequency vs time of day were obtained with National Bureau of Standards world maps, and compared with the measurements. These curves predict certain features of RTW propagation, but provide too low an estimate of the max frequency that can propagate at any given time, if ionospheric tilts are neglected. The dominant propagating mode is concluded to be a combination of earth-ionosphereearth hops on parts of the path, and F2-layer to - F2-layer hops, made possible by layer tilts, on the remainder of the path. (Author).

Paraxial Solutions for Decelerated Axially Symmetric Space Charge Flow May 06 2020 Solutions for space-charge-flow based on the well known axially symmetric paraxial approximation are presented. This permits, under a unified heading, some new solutions plus restatements and extensions of results previously appearing in separate contexts. In addition to the well known Universal Beam Spread Curve, solutions for linear, parabolic, and sinusoidal axial potential variations are obtained. The axial potential variation is solved for producing specified hyperbolic and parabolic beam trajectories. Following the trajectories and axial potentials obtained from the paraxial ray equation, representative approximate solutions are presented for the potentials within and outside the beam. These are obtained over limited regions by use of series expansions similar to those used in obtaining the paraxial approximation. The scale of the potential variations and trajectories were chosen primarily to show beam spreading in cases for which the space-charge forces are important and the beam potential is significantly depressed. This study had as a background the investigation of the axially symmetric depressed collector. (Author).
