Introduction to Neural and Cognitive Modeling Jun 19 2021 This textbook provides a general introduction to the field of neural networks. Thoroughly revised and updated from the previous editions of 1991 and 2000, the current edition concentrates on networks for modeling brain processes involved in cognitive and behavioral functions. Part one explores the philosophy of modeling and the field's history starting from the mid-1940s, and then discusses past models of associative learning and of short-term memory that provide building blocks for more complex recent models. Part two of the book reviews recent experimental findings in cognitive neuroscience and discusses models of conditioning, categorization, category learning, vision, visual attention, sequence learning, behavioral control, decision making, reasoning, and creativity. The book presents

these models both as abstract ideas and through examples and concrete data for specific brain regions. The book includes two appendices to help ground the reader: one reviewing the mathematics used in network modeling, and a second reviewing basic neuroscience at both the neuron and brain region level. The book also includes equations, practice exercises, and thought experiments.

Transcendental Representations with Applications to Solids and Fluids Jun 07 2020 Building on the author's previous book in the series, Complex Analysis with Applications to Flows and Fields (CRC Press, 2010), Transcendental Representations with Applications to Solids and Fluids focuses on four infinite representations: series expansions, series of fractions for meromorphic functions, infinite products for functions with infinitely many zeros, and continued fractions as alternative representations. This book also continues the application of complex functions to more classes of fields, including incompressible rotational flows, compressible irrotational flows, unsteady flows, rotating flows, surface tension and capillarity, deflection of membranes under load, torsion of rods by torques, plane elasticity, and plane viscous flows. The two books together offer a complete treatment of complex analysis, showing how the elementary transcendental functions and other complex functions are applied to fluid and solid media and force fields mainly in two dimensions. The mathematical developments appear in odd-numbered chapters while the physical and engineering applications can be found in even-numbered chapters. The last chapter presents a set of detailed examples. Each chapter begins with an introduction and concludes with related topics. Written by one of the foremost authorities in aeronautical/aerospace engineering, this self-contained book gives the necessary mathematical background and physical principles to build models for technological and scientific purposes. It shows how to formulate problems, justify the solutions, and interpret the results.

Transcendental Phenomenological Psychology Sep 10 2020 From the Preface to the Revised Edition: Since its publication in 2007, Transcendental Phenomenological Psychology has been sold on every continent (except Antarctica), and is in the collections of research libraries in North America, Europe, and Asia. Even so, its presentation to the academic community rightly provoked many comments, corrections, suggestions, and criticisms. Such input, while mostly welcome, provided the impetus to publish a revised edition. A phenomenological explanation of human consciousness has long been sought in regions of psychology since the discipline was first carved out of philosophical concepts and theories about the human condition. In its earliest years, Western psychology was faced with two possible directions for this explanation: an empirical naturalistic approach along with physics and biology, or a non-empirical eidetic approach along with logic and mathematics. Edmund

Husserl took up the latter. His phenomenological tradition of inquiry successfully spanned nearly forty years until suddenly stopped and largely suppressed during the Second World War. This book recovers Husserl's revolutionary approach toward the human sciences, just as it was developed, and just as it is presented for further study. Here, the author systematically gathers what Husserl calls the "leading clues" in the phenomenological method proper for a psychology of affective inner experience, and then for the first time applies Husserl's own methodology for introducing a phenomenological psychology in the transcendental register of human consciousness. Unlike contemporary phenomenological psychology in the existential register, transcendental phenomenological psychology is presented as an eidetic non-empirical "act psychology" in Husserl's mature genetic phenomenology. This novel approach takes in the full range of solipsistic and transcendental subjectivity in Husserl's theories of human consciousness, and follows Husserl's lead in presenting phenomenological psychology as an "applied geometry" of intentional experience within a step-wise theory of inquiry. This book is unique in human science today, not only in its presentation of the development and applications of Husserl's key concepts for the discipline of psychology, but also for introducing a psychology that could be intuitively grasped as self-evidently valid wherever one's interest might lie.
